

## HIGH SIDE CURRENT MONITOR WITH EXTENDED VOLTAGE RANGE

ABSTRACT OF THE DISCLOSURE

A high side current monitor circuit includes an op amp which is coupled across a sensing element which carries a current  $I_{\text{sense}}$  and develops a shunt voltage  $V_{\text{sense}}$ . A feedback  
5 transistor driven by the op amp output conducts an output current  $I_{\text{out}}$  through a resistor to a current output node necessary to make the op amp inputs equal, such that  $I_{\text{out}}$  is proportional to  $I_{\text{sense}}$ .  $I_{\text{out}}$  is conducted through a resistor to generate a ground-referred voltage proportional to  $V_{\text{sense}}$ .  
10 When the common mode voltage of  $V_{\text{sense}}$  is greater than the op amp's breakdown voltage, a discrete transistor is connected between the current output node and ground to stand off the voltage across the amp. The monitor circuit is arranged such that it can be powered with a limited fraction of the  
15 common mode voltage when used with a discrete transistor, and is self-biased when used without a discrete transistor.
